

Develop a Spring Based Application called "*Bloggify*" for creating and managing Blogs.

Here are some basic features I can think of for now but you are free to add additional specs to the system.

1. Landing page—shows a list of blogs with the links to each blog.
2. When a user clicks on any of the blogs, the system opens it in view mode along with all (approved) comments.
3. A user can add comments to the same screen.
4. Apart from this, a user can search for the blog with given search text, targeting the title or body of the blog.
5. There is a login feature. Two people can log into the application—a blog user and an admin:
 - 5.1. Blog user can add/update/delete the blog. He can only edit the blogs he created.
 - 5.2. Admin user can perform all possible operations a blog user can do plus manage (approve or reject) the comments given by the anonymous user.
6. When any user adds a comment, an email will be sent to the admin user to moderate it. Once the comment is approved, an email will be sent back to the user as a notification.
